

Ugence + ServiceNow for City-Scale Vehicle Intelligence

Proposed Product Integration Architecture, Governed Workflows and Execution-Assurance Case Study

The vehicle-intelligence platform determines what the evidence indicates. ServiceNow manages the enterprise records, workflows, cases, policies, assets, AI governance and coordination. Ugence composes with ServiceNow as an independently verifiable action-level authority and execution-assurance service.

Prepared by Ugence Labs

ugence.ai · Integration Edition v1.1 · ServiceNow research 15 August 2026

PROPOSED SERVICENOW INTEGRATION — no Ugence ServiceNow connector currently ships. Illustrative, technically realistic composition; not a deployed customer integration, a certified ServiceNow application, a Store listing, a completed joint product, or ServiceNow endorsement. Not legal advice. ServiceNow capabilities are cited from official sources; verify on the live documentation before customer use.

1. Purpose, scope and how to read this document

This is the ServiceNow-integrated edition of the Ugence city-scale vehicle-intelligence briefing. It proposes how the current Ugence governance and execution-assurance architecture could **compose with ServiceNow** to govern a city-scale vehicle-intelligence system — traffic-signal violation detection, ANPR/ALPR, vehicle re-identification, trajectory reconstruction, bounded investigation, registry access, and citation or enforcement proposals.

The vehicle-intelligence platform determines what the evidence indicates. ServiceNow manages the enterprise records, workflows, cases, policies, assets, AI governance and operational coordination. Ugence composes with ServiceNow as an independently verifiable action-level authority and execution-assurance service — determining what may be concluded, disclosed, investigated or executed under the applicable evidence, policy, authority, purpose and scope, and verifying that the attempted action, executed action and observed effect remained within that authorization.

Integration status (applies throughout)

Every Ugence–ServiceNow exchange in this document is a PROPOSED SERVICENOW INTEGRATION — no Ugence ServiceNow connector currently ships. Nothing here implies a deployed customer integration, a certified ServiceNow Store application, a production connector, a completed joint product, or ServiceNow endorsement. The case study is illustrative and technically realistic, not a claimed customer deployment.

Relationship to the v2.0 brief

This edition does not replace the vendor-neutral v2.0 brief, which remains the source of record for Ugence architecture, module behavior, maturity and responsibility boundaries. Where the two differ, v2.0 governs the Ugence side; this edition adds only the proposed ServiceNow composition.

1.1 Partnership framing (composition, not replacement)

This document is written as a partnership composition. It does **not** state or imply that ServiceNow lacks governance, cannot enforce actions, only inventories AI, or must be replaced; and it does not describe Ugence as sitting “above” ServiceNow. ServiceNow is the enterprise platform and business system of record; Ugence contributes a narrow, independently verifiable, action-specific authority-and-assurance service that binds to the exact purpose, payload, target and case.

1.2 ServiceNow research method, date and confidence

ServiceNow capabilities were researched on **15 August 2026** against official ServiceNow-owned sources only, in the priority order: current product documentation (docs.servicenow.com / servicenow.com/docs), current release notes, ServiceNow Newsroom, ServiceNow Community, and product pages only where documentation did not cover a capability. Third-party summaries were not used for product behavior.

Verification and discovery

Every ServiceNow capability described here is attributed to a specific official ServiceNow source in Section 21 (with the complete URL, source title, target release where applicable, and access date). Any capability, SKU, table, API, licensing or availability specific that is release-, instance- or contract-dependent is labelled “DISCOVERY QUESTION — CONFIRM WITH SERVICENOW” and consolidated in Section 20; each cited page should be re-opened and pinned to the customer’s target release before customer use. No assumption is made that any product is licensed or installed in a prospective customer’s instance.

1.3 Maturity labels

Ugence capabilities carry the same conservative maturity labels as the v2.0 brief: **IMPLEMENTED + CI** (merged to the default branch with its own tests in CI), **IMPLEMENTED** (merged, tested, but no dedicated CI or not production-validated), **REFERENCE**, **DESIGN-ONLY** and **FUTURE**. These describe engineering status only — never production deployment, legal sufficiency, or formal proof. ServiceNow product availability is described only as ServiceNow’s official sources state it, with licensing left to discovery.

2. Executive summary

A city-scale vehicle-intelligence system can detect violations, read plates, correlate cameras and reconstruct a vehicle’s journey. Turning those technical findings into lawful, controlled, auditable government action requires three things working together: a platform that sees, an enterprise system that manages the case and the policy, and an independent authority that decides — per exact action — what may proceed and proves the effect stayed within that authorization.

- **The vehicle platform** determines what the evidence indicates (perception, re-identification, trajectory). Raw video and high-volume sensor data stay in that authorized platform.
- **ServiceNow** is the business system of record and coordination layer: the investigative case (Public Sector Digital Services / Investigative Case Management), purpose and scope, human approvals, the policy and control library (Integrated Risk Management), the AI-governance record (AI Control Tower), asset context (CMDB / optional OT Management), workflow orchestration (Flow Designer / AI Action Fabric / IntegrationHub), and analytics.
- **Ugence** composes as an independently verifiable action-level authority and execution-assurance service: it admits trusted evidence, binds a governed decision, confirms model eligibility, mints one signed authorization, authorizes the exact action, checks live safety, and reconciles the observed effect — writing every artifact back to the ServiceNow case.

The result is a clean separation of duties in which no system both proposes and authorizes a consequential action, ServiceNow remains the system of record, and Ugence provides an independent, action-specific proof that binds authority to the exact purpose, payload, target and case.

PROPOSED SERVICENOW INTEGRATION — no Ugence ServiceNow connector currently ships. Illustrative, technically realistic composition; not a claimed deployment.

Figure 1. Responsibility at a glance across the five actors — vehicle/city (cyan), ServiceNow (green), Ugence (violet), external consequence systems (grey) and human authority. Every integration is PROPOSED.

Recommended posture

Recommended posture for the partnership discussion: ServiceNow-led orchestration (Pattern A), in which a ServiceNow Playbook, AI Action Fabric flow owns the business workflow and submits each consequential action to Ugence before dispatch. A Ugence Agent Runtime coordination pattern (Pattern B) is available for bounded agentic investigation. The two are never blurred (Section 11).

3. The five-actor composition

The architecture separates five actors. The colour bands used in every diagram in this document are: **vehicle/city** systems (cyan), **ServiceNow** (green), **Ugence** (violet/blue/teal), **external consequence** systems (grey), and **human authority** (amber).

Actor	Role in the composition
Vehicle-intelligence / city platform	Determines what the evidence indicates; retains raw video and sensor data; emits provenanced evidence references.
ServiceNow	Business system of record and coordination: case, purpose/scope, approvals, policy & control library, AI-governance record, asset context, workflow orchestration, analytics.
Ugence	Independent action-level authority and execution assurance: evidence admission, governed decision, model eligibility, signed authority, exact-action authorization, live clearance, effect verification.
External consequence systems	Carry out the authorized effect (traffic enforcement, registry, police, notification, citation).
Human authority	Approves, reviews and hears appeals; never bypassed where policy requires it.

Table 1. The five actors and their role.

The governing invariant is unchanged from the vendor-neutral brief: the operational intelligence system proposes; it does not self-assign the authority to execute. ServiceNow coordinates the business process and holds the records; Ugence independently authorizes the exact action and verifies the effect.

4. ServiceNow product map

The products below are mapped only where they are genuinely relevant to this use case, and grouped by role. Not every product belongs in the primary pipeline. Availability and licensing are matters for discovery (Section 20); product behavior is cited from official ServiceNow sources (Section 21).

Products are mapped only where genuinely relevant. Availability, SKU, table and licensing specifics are DISCOVERY QUESTIONS to confirm with ServiceNow. Named "ServiceNow AI Action Fabric" (some official materials shorten it to "Action Fabric"). Data access and action orchestration are distinct: Workflow Data Fabric / Zero Copy Connectors reference external data without copying where supported; IntegrationHub / Stream Connect / REST handle ingestion and orchestration.

Figure 2. ServiceNow product architecture, grouped by role. The AI-agent system of action is "ServiceNow AI Action Fabric" (some official materials shorten it to "Action Fabric"); Workflow Data Fabric / Zero Copy Connectors and IntegrationHub / Stream Connect / REST are distinct mechanisms.

Group	Products	Role in this use case
Core pipeline	Workflow Data Fabric / Zero Copy Connectors (reference); IntegrationHub / Stream Connect / REST (ingest & orchestrate); PSDS case management / Investigative Case Management where licensed and available; Workflow Studio / Flow Designer; ServiceNow AI Action Fabric	Reference or ingest evidence, assemble the case and context, dispatch authorized actions.
Supporting governance	AI Control Tower; Integrated Risk Management; Policy & Compliance Management; CMDB; Platform / Performance Analytics	Systems of record for AI governance, policy/controls, assets and measurement.
Exception & escalation	Security Incident Response; Security Case Management	Handle credential-abuse / tampering / unauthorized-access conditions.
Optional operational		

Group	Products	Role in this use case
	Operational Technology Management; Field Service Management; Government Service Portal	Asset health & field remediation; constituent self-service — engaged only when relevant.
Discovery	(see Section 20)	SKU, table, API, licensing and availability confirmations required before customer use.

Table 2. ServiceNow product map by role.

On ServiceNow AI Action Fabric

Naming: this document uses “ServiceNow AI Action Fabric,” the name used in current official ServiceNow documentation; some official materials shorten it to “Action Fabric.” It exposes ServiceNow’s governed system of action to AI agents through the generally available MCP Server, managed via the MCP Server Console, with actions governed by AI Control Tower. Confirm the exact current name and spelling on docs.servicenow.com for the target release.

5. The primary ServiceNow-integrated pipeline

The primary pipeline threads city intelligence, ServiceNow context assembly, Ugence governance and external execution, with assurance written back to the ServiceNow case. It is presented in two phases for portrait reading: authorization and clearance (Phase 1), then dispatch, execution and assurance (Phase 2).

5.1 Phase 1 — evidence, context and authorization

Phase 1: ServiceNow assembles the case and context; Ugence independently admits evidence, binds a decision, confirms model eligibility, mints the one signed authority, authorizes the exact action and checks live safety. PROPOSED integration.

Figure 3a. Phase 1: ServiceNow assembles the case and context; Ugence independently admits evidence, binds a decision, confirms model eligibility, mints the one signed authority, authorizes the exact action and checks live safety. Fail-closed dispositions return an auditable reason to the ServiceNow case.

5.2 Phase 2 — dispatch, execution and assurance

Phase 2 has two alternative execution branches; exactly one is in force per action, and ServiceNow dispatch and Agent Runtime are never sequential co-owners of one execution attempt. Pattern A: ServiceNow dispatches, the external system returns a receipt, RA-8 assures, ServiceNow writes back. Pattern B: Ugence Agent Runtime invokes the external executor, the result returns to Agent Runtime which emits the receipt to RA-8, then ServiceNow writes back. PROPOSED integration.

Figure 3b. Phase 2: only an authorized, cleared action is dispatched; the external effect returns for assurance (RA-8) and the complete lineage is written back to the ServiceNow case.

At each governance step, a DENY, INDETERMINATE, HOLD, BLOCK or ESCALATE outcome returns a machine-readable reason to the originating ServiceNow case rather than proceeding. Only the signed Risk Authority envelope is machine authority; no ServiceNow record, policy result, model status or receipt independently grants execution.

6. Data-minimizing architecture

The default design keeps raw surveillance data out of ServiceNow. Raw video and high-volume sensor data remain in the authorized city or vehicle-intelligence evidence platform. ServiceNow receives case-relevant metadata, secure references, provenance identifiers, digests, timestamps, confidence, evidence class and retrieval authorization — not the raw imagery. Two ServiceNow mechanisms are distinct and should not be conflated: **Workflow Data Fabric / Zero Copy Connectors** can, where supported, provide real-time access to external data without copying it into the platform; while **IntegrationHub, Stream Connect, REST or custom APIs** handle event ingestion and action orchestration. Not every IntegrationHub exchange is zero-copy: whether a given exchange references data in place or ingests a copy depends on the connector and pattern chosen.

Boundary	Crosses by default	Stays put
City platform → ServiceNow	Case-relevant metadata, secure references, provenance IDs, content digests, timestamps, confidence, evidence class, retrieval authorization	Raw video and high-volume sensor data (retained in the city evidence platform)
ServiceNow → Ugence	The assembled case context and evidence references (a PROPOSED governance request)	ServiceNow record ownership; Ugence emits separate governance artifacts and does not rewrite the case
Ugence → external system	Only an authorized, cleared exact action	Any unauthorized or uncleared action

Table 3. What crosses each boundary by default.

Zero-copy is connector-specific

ServiceNow Workflow Data Fabric's Zero Copy Connectors are documented to access external data in place and in real time “without ever having to move the data,” retrieving exactly what is needed. This supports a reference/virtualize model for supported connectors rather than bulk-copying raw evidence into ServiceNow. It is connector-specific: whether a given source is truly zero-copy (left at rest in the external system), and the exact credit / entitlement model, are discovery questions (Section 20). IntegrationHub / Stream Connect / REST exchanges are a separate mechanism for ingestion and orchestration and are not, in general, zero-copy. Source: ServiceNow Workflow Data Fabric documentation (Section 21).

- **ServiceNow does not become the computer-vision inference engine.** Perception and re-identification remain in the city platform.
- **Ugence does not become the long-term case-management system.** The case of record remains in ServiceNow; Ugence reads or references evidence and emits separate governance artifacts.
- **Ugence does not silently rewrite the original evidence.** It preserves provenance and epistemic status and adds governance records alongside.

Alternative pattern (requires review). If a deployment must stage evidence references or derived metadata inside ServiceNow (for example, to support offline case work), that is a distinct storage pattern requiring the customer's architecture, privacy and retention review, and is not the default proposed here.

7. Ugence–ServiceNow responsibility matrix

The matrix below assigns each responsibility to exactly one accountable owner. Where a responsibility is genuinely shared, it crosses a PROPOSED interface and the boundary is stated. No single binding responsibility is assigned to two systems.

No single binding responsibility is assigned to two systems. Policy & control records are ServiceNow's system of record (IRM); the signed per-action authority is Ugence's. Shared items cross a PROPOSED interface only.

Figure 4. Ownership bands: vehicle/city, ServiceNow (business system of record), Ugence (independent action-level authority & assurance), external consequence systems and human authority.

Responsibility	Owner	Boundary note
Source evidence	Vehicle/city platform	Perception, ANPR, re-ID, trajectory.
Evidence storage	Vehicle/city platform	Raw data retained; not moved to ServiceNow by default.
Evidence provenance	Vehicle/city platform	Provenance references travel with the evidence.
AI model inventory	ServiceNow (AI Control Tower)	AI asset inventory / registration is ServiceNow's system of record.
Model eligibility for a particular action	Ugence (Model Authority)	Consumes a trusted, versioned AI-governance fact from AI Control Tower; the per-action eligibility decision is Ugence's.
Policy authorship	Human authority / government	Neither ServiceNow nor Ugence authors the underlying policy.

Responsibility	Owner	Boundary note
Policy & control system of record	ServiceNow (IRM / Policy & Compliance)	Authority documents, policies, controls, exceptions, remediation.
DecisionCase and CER	Ugence	Governed decision & authority context; not a replacement for the ServiceNow case.
Signed machine authority	Ugence (Risk Authority)	The single signed, scoped authorization envelope.
Exact-action authorization	Ugence (ActionGate)	AUTHORIZED / DENIED / INDETERMINATE / EXPIRED.
Live clearance	Ugence (Action Clearance)	CLEAR / HOLD / BLOCK / ESCALATE at the edge of execution.
Workflow orchestration	ServiceNow (Flow Designer / AI Action Fabric / IntegrationHub)	Owns the business workflow and dispatch (Pattern A).
External-system execution	External consequence system	Carries out the authorized effect.
Execution receipt	External system → Ugence	Receipt returned for assurance.
Effect verification	Ugence (RA-8)	Reconciles observed effect vs authorization; never re-authorizes.
Case lifecycle	ServiceNow (PSDS / ICM)	The investigative/enforcement case of record.
Human review	Human authority (via ServiceNow)	ServiceNow routes review activities; humans decide.
Appeals	Human authority (via ServiceNow)	Contested evidence / corrected identity represented in the case.
Security incidents	ServiceNow (SIR / Security Case Mgmt)	Credential abuse / tampering handled as security work.
Field-maintenance work	ServiceNow (FSM, + CMDB/OT)	Asset failure handled as a work order.
KPI and ROI reporting	ServiceNow (Platform/ Performance Analytics, AI Control Tower)	Operational measurement & value are ServiceNow's; Ugence contributes evidence-backed attribution (Section 16).

Table 4. Responsibility matrix. Owner = the single accountable system for that item.

8. ServiceNow as the business system of record

Where supported by official documentation, Public Sector Digital Services (PSDS) and its Investigative Case Management (ICM) capability — where licensed and available — serve as the primary case layer. PSDS is ServiceNow's purpose-built platform for digital government, built on the Customer Service Management case foundation, with a government data model that supports case types and agency services. ICM is a mission-built, AI-native solution for organizing, tracking and resolving government investigations, in which the narrative, evidence, entities, tasks and team members live in a single structured record, with entities (persons, organizations, property, vehicles, locations, events, firearms) managed through a master index.

Case element	Held or referenced in ServiceNow (PSDS / ICM)
Event & evidence references	Event entity + evidence records (references, provenance IDs, digests) — raw data stays in the city platform
Purpose & bounded scope	Case purpose, ± time window, geography, data-class scope
Jurisdiction	Jurisdiction / tenant on the case (confirm native vs configured — discovery)
Requested action	The proposed external action and parameters
Human approvals	Approval activities and approver identity
Ugence decision reference	Reference to the Ugence DecisionCase
Signed-authorization reference	Reference to the Risk Authority envelope
ActionGate disposition	AUTHORIZED / DENIED / INDETERMINATE / EXPIRED + reason codes
Action Clearance result	CLEAR / HOLD / BLOCK / ESCALATE
Execution-receipt reference	Reference to the external execution receipt
RA-8 effect result	MATCHED / MISMATCH / PARTIAL
Exception, appeal & escalation status	Linked IRM issue/exception, appeal and escalation state

Table 5. What the ServiceNow case holds or references.

DecisionCase vs the ServiceNow case

The Ugence DecisionCase and Context Envelope Record (CER) remain the governed decision and authority context; they are not a replacement for, and do not duplicate, the ServiceNow case of record. The ServiceNow case references the Ugence decision; the Ugence decision references the ServiceNow case. Sources: docs.servicenow.com PSDS (Explore Public Sector Digital Services; PSDS data model); ICM (psds-explore-inv-case-management); CSM case management (accessed 2026-08-15). ICM availability ("Q1 2026, all PSDS customers") and exact entity/field schemas are discovery questions.

9. Integrated Risk Management and Policy & Compliance

ServiceNow Integrated Risk Management (IRM) and Policy and Compliance Management are positioned as the system of record for authority documents, policies, regulations, control objectives, controls, exceptions, compliance issues, remediation workflows and dashboards. IRM provides a unified GRC data model as a single source of truth for risk and compliance data across Risk Management, Policy and Compliance, Vendor Risk and Operational Risk.

Through a PROPOSED interface, Ugence receives **approved, versioned policy and control references** from IRM. The Ugence Policy Workflow Compiler may compile an approved policy pack into deterministic runtime constraints — but it does not author or approve the underlying government policy, and it is tooling, not authority.

Compliance status ≠ per-action authority

Boundary: an IRM compliance status is relevant evidence — it is not automatically a signed per-action authorization. Only the Ugence Risk Authority envelope is machine authority. IRM remains the system of record for the compliance library and its lifecycle; Ugence adds an independent, action-specific authorization bound to the exact case, payload and target. Whether ServiceNow uses the exact phrase “system of record” for IRM, and the precise current module/table list, are discovery questions. Sources: servicenow.com IRM & Policy and Compliance Management product/docs pages; ds-Integrated-risk-management.pdf (accessed 2026-08-15).

10. AI Control Tower integration

ServiceNow AI Control Tower already governs and provides visibility into enterprise AI — it is documented to discover, observe, govern, secure and measure AI assets, models, agents and use cases across ServiceNow and third-party systems, including AI use-case registration, a unified AI asset inventory (agents, models, copilots, MCP servers, datasets) tied to CMDB, lifecycle status, approved-provider/model status with enforcement at the model-configuration level, embedded governance and risk context, and AI adoption / realized-value / ROI reporting.

Ugence does **not** fill an absent ServiceNow AI-governance capability. Through a PROPOSED interface, Ugence Model Authority **consumes a trusted, versioned AI-governance fact** from AI Control Tower — for example, whether a specific ANPR or re-identification model version is approved — and issues its own narrower, action-specific decision: whether that model may act in this exact decision class, for this exact purpose, payload, target and case.

Complementary, not a gap-filler

Ugence's proposed contribution is action-specific, independently verifiable authority and execution evidence bound to the exact action — complementary to, and dependent upon, AI Control Tower's enterprise AI-governance system of record. Whether “AI Use Case registration” is a first-class documented object (and its exact table), and current licensing (bundled vs standalone), are discovery questions. Sources: servicenow.com/products/ai-control-tower.html; docs.servicenow.com ai-control-tower ai-inventory / ai-assets; newsroom 2025 & 2026 AI Control Tower releases (accessed 2026-08-15).

11. Two execution patterns (kept separate)

Two execution patterns are presented and never blurred. In any scenario, exactly one pattern is in force, and ServiceNow and Ugence are never simultaneous owners of the same execution state.

Pattern A — ServiceNow-led orchestration (recommended)**RECOMMENDED**

Owner of the business workflow	ServiceNow Playbook, Flow Designer or AI Action Fabric.
Governance step	Each consequential action is submitted to Ugence before dispatch.
Ugence returns	AUTHORIZED / DENIED / INDETERMINATE (ActionGate) and CLEAR / HOLD / BLOCK / ESCALATE (Action Clearance), with artifact references.
Dispatch	ServiceNow dispatches only an authorized and cleared action through IntegrationHub or an approved external integration.
Assurance	The result returns to Ugence for assurance, then to the ServiceNow case.

Pattern B — Ugence Agent Runtime coordination		FOR BOUNDED AGENTIC WORK
Owner of coordination	Ugence Agent Runtime coordinates a bounded agentic investigation or provider attempt.	
Execution adapter	It invokes a PROPOSED ServiceNow execution adapter only after authorization and clearance.	
Receipt	The execution result returns to Agent Runtime, which emits the execution receipt to RA-8.	
Assurance	The final assurance verdict is written back to the ServiceNow case.	

For every scenario in this document, the pattern in force is stated. The red-light citation (Section 12) uses Pattern A. The bounded trajectory investigation (Section 13) uses Pattern A (ServiceNow-coordinated), with the PSDS case as system of record.

12. Red-light citation walkthrough (Pattern A)

This rewrites the v2.0 red-light citation using the ServiceNow-integrated pipeline, in Pattern A (ServiceNow-led dispatch).

Successful path (Pattern A, ServiceNow-led dispatch). Only an authorized, cleared exact action reaches the external system; the effect is verified and the lineage lands on the ServiceNow case. Illustrative example; PROPOSED integration.

Figure 5. The successful red-light citation path: city evidence → ServiceNow case + context → Ugence governance → ServiceNow dispatch → external execution → RA-8 assurance → PSDS case updated with full lineage.

1. The vehicle platform detects the Junction 44 red-light event; raw imagery is retained in the city platform.
2. Workflow Data Fabric / Zero Copy Connectors reference the evidence in place where supported (or IntegrationHub / Stream Connect / REST ingest it); PSDS case management / Investigative Case

Management creates or updates the case (purpose = enforcement, bounded scope, jurisdiction), where licensed and available.

3. ServiceNow assembles context: IRM policy and control references, AI Control Tower ANPR-model governance status, CMDB (or optional OT Management) camera and signal-controller context.
4. A PROPOSED governance request goes to Ugence: RA-5 admits the evidence (integrity, freshness, schema); Decision Authority binds a DecisionCase + CER.
5. Model Authority confirms the ANPR model version is eligible for enforcement (consuming the AI Control Tower fact); Risk Authority mints the signed authorization envelope.
6. ActionGate authorizes the exact ISSUE_TRAFFIC_CITATION action (AUTHORIZED); Action Clearance returns CLEAR.
7. ServiceNow dispatches the authorized action to the external traffic-enforcement system (Flow Designer / AI Action Fabric / IntegrationHub).
8. The external system returns an execution receipt; RA-8 reconciles the observed effect.
9. PSDS updates the case and preserves the complete evidence → decision → authority → action → effect lineage.

12.1 HOLD / DENY / INDETERMINATE path

Uncertain identity is preserved, never converted to fact.

The auditable reason is written back to the ServiceNow case, which routes human review. Illustrative example.

Figure 6. The failure / uncertainty path: any governance step can return a non-authorizing disposition with reason codes; the auditable reason is written back to the PSDS case, which routes human review. Uncertain identity is preserved, never converted to fact.

For example, with plate confidence below the binding threshold, ActionGate returns a non-authorizing disposition; no citation, disclosure or identity assertion occurs. The PSDS case records the reason codes and opens a human-review activity or a request for further admissible evidence.

13. Scenario — bounded trajectory investigation

PSDS case management / Investigative Case Management (where licensed and available) owns the investigation case. A ServiceNow Agentic Playbook or AI Action Fabric flow coordinates investigation activities, while Ugence independently authorizes each consequential expansion. This scenario uses Pattern A (ServiceNow-coordinated): the PSDS case is the coordinating system of record and Agent Runtime is not the execution owner here.

Scenario — Pattern A (ServiceNow-coordinated): a ServiceNow Agentic Playbook / AI Action Fabric flow coordinates the investigation and the PSDS case is the system of record; Ugence independently authorizes each consequential expansion; results and escalation reasons return to the case. Agent Runtime is not the execution owner here. Technical ability to query is never authority to query. Illustrative.

Figure 7. Bounded trajectory investigation: each request to widen time, geography, identity or data class becomes a separately governed action; results and escalation reasons return to the investigative case.

- The PSDS case establishes a bounded purpose, ± time window and route-connected geography before any broad camera search.
- Each proposed investigation step (another camera search, a wider window, a new zone, registry resolution, disclosure) is submitted to Ugence as a discrete governed action.
- Ugence checks it against the DecisionCase scope; a wider window, new geography, identity resolution or new data class each require a NEW governed decision (DENY / ESCALATE otherwise).
- Results, and any escalation reasons, return to the investigative case; the investigator sees direct observations and inferred transitions kept distinct.

Scope is authority, not capability

Technical ability to run a query is never authority to run it. “Search every camera in the city for seven days” can be technically feasible and still return DENY because the case authorizes only a bounded, route-connected search. Illustrative example.

14. Scenario — uncertain identity

When the evidence remains ambiguous, Ugence does not turn confidence into identity fact.

- Plate and re-identification confidence are below the policy binding threshold (for example, plate 82% against a 97% threshold with no approved human corroboration).
- ActionGate returns a non-authorizing disposition (INDETERMINATE / HOLD) with reason codes.
- PSDS creates a human-review activity or requests further admissible evidence; the ambiguity is preserved on the case, not resolved by fiat.
- No citation or identity disclosure occurs without sufficient evidence and appropriate authority.

This is the same discipline as the vendor-neutral brief, expressed through the ServiceNow case: the auditable reason lands on the PSDS case, and human authority decides the next step.

15. Optional operational branches

Two optional branches sit outside the ordinary citation pipeline. They engage only on genuine asset-failure or security conditions — an ordinary traffic citation is neither a field-service work order nor a security incident.

Optional operational extensions — outside the ordinary citation pipeline. An ordinary traffic citation is neither a field-service work order nor a security incident; these branches engage only on genuine asset-failure or security conditions. PROPOSED integration; illustrative.

Figure 8. Optional operational extensions: asset failure routes through CMDB / OT Management → Field Service Management; suspected credential abuse routes through Security Incident Response / Security Case Management, which can trigger a Ugence authority revocation or hold.

- **Camera or signal-controller malfunction.** CMDB (or optional Operational Technology Management) records the asset-health condition; Field Service Management raises a work order and

dispatches a technician; the asset-health result returns to the case. (Whether cameras and signal controllers are out-of-box OT device classes is a discovery question.)

- **Suspected credential abuse, tampering or unauthorized surveillance access.** Security Incident Response / Security Case Management runs a security investigation; where appropriate, Ugence RA-6 issues an authority revocation or hold signal, restricting authority downstream.

16. Analytics and governed value

ServiceNow Platform Analytics, Performance Analytics and AI Control Tower already support operational measurement, AI adoption, realized value and ROI reporting. This document does not claim ServiceNow lacks ROI measurement.

Ugence Governed Value remains labelled by its actual maturity — **EXPERIMENTAL / REPORTED / UNVERIFIED** — with no authority binding and no continuous integration. It is not an authorization stage. The proposed future contribution is **evidence-backed outcome attribution** that connects approved objectives, a workflow baseline, the governed decision and authorization, execution receipts, observed outcomes, model and infrastructure costs, attribution rules, and preserved risk / compliance / quality / service constraints — reusing the governance evidence the pipeline already emits, adding attribution rather than a new gate.

Governed Value maturity

Governed Value is an experimental reporting kernel (REPORTED / UNVERIFIED). It does not attest outcomes, does not grant authority, and must not be read as an audited financial result. Operational KPI and ROI reporting are ServiceNow's (Platform/Performance Analytics, AI Control Tower).

17. Interface-level integration catalogue

Each proposed exchange is described at the safe-to-share interface level — no source code, proprietary algorithms, complete schemas, key handling, internal thresholds or credentials. Every row is a PROPOSED SERVICENOW INTEGRATION.

#	ServiceNow trigger / record	Input referenced	Ugence module	Artifact emitted	ServiceNow record updated	On failure / uncertainty
I-1	PSDS case created / action proposed	Evidence refs, purpose, scope, approvals	RA-5 → Decision Authority	AdmittedEvidence; DecisionCase + CER	Case: decision reference	Reason codes → case; human-review activity
I-2	AI Control Tower model-status query	Model id/ version, approval status	Model Authority	ModelAuthorizationDecision	Case: model-authorization ref	DENY/HOLD → case
I-3	IRM policy/ control reference	Approved, versioned policy pack refs	Policy Workflow Compiler → Risk Authority	Compiled constraints; signed envelope	Case: authorization ref	No authority issued → case

#	ServiceNow trigger / record	Input referenced	Ugence module	Artifact emitted	ServiceNow record updated	On failure / uncertainty
I-4	Exact-action submission (Pattern A)	Action type, target, parameters, digest	ActionGate	ActionGovernanceResult	Case: disposition + reason codes	DENIED/ INDETERMINATE → case
I-5	Pre-dispatch clearance	Authorized action + live signals	Action Clearance	ClearanceResult (CLEAR/ HOLD/BLOCK/ESCALATE)	Case: clearance result	HOLD/BLOCK/ ESCALATE → case
I-6	Dispatch result (receipt)	Execution receipt / external result	RA-8 (+ Agent Runtime, Pattern B)	EffectAssuranceAssessment	Case: effect result; IRM issue if mismatch	MISMATCH/ PARTIAL → IRM issue + case
I-7	Reassessment signal	RA-7/RA-8 signals	RA-6	Authority lifecycle mutation	Case: authority state; SIR link if security	Revoke/hold → case

Table 6. Proposed ServiceNow ↔ Ugence integration points (interface level).

Property	Expectation
Success behavior	Authorized + cleared action dispatched by ServiceNow; artifacts referenced on the case.
Failure / uncertainty behavior	Fail closed; machine-readable reason returned to the originating ServiceNow case; no default-allow.
Idempotency / replay	Requests carry an idempotency key; clearances are digest/expiry-bound and rejected on replay or parameter drift.
Audit reference	Every artifact is referenced from the ServiceNow case, forming an evidence → authority → action → effect chain.
Integration status	PROPOSED SERVICENOW INTEGRATION — no connector ships; interface shapes are illustrative and subject to discovery.

Table 7. Cross-cutting expectations for every integration point.

18. Runtime, execution and effect assurance with write-back

Governance does not end at authorization. Authorization, attempt, execution and effect are distinct records, reconciled and written back to the ServiceNow case.

Authorization, attempt, execution and effect are distinct records. RA-8 never retroactively authorizes; RA-7/RA-8 emit neutral reassessment signals to RA-6, which may only restrict authority. Every verdict is written back to the ServiceNow case. Verification strength is bounded by the effect source.

Figure 9. Authorization vs attempt vs execution vs effect, with RA-7 (in-flight) and RA-8 (post-effect) reassessment signals feeding RA-6, and every verdict written back to the ServiceNow case.

Record	What it captures	Owner	Write-back
Authorization	The signed, scoped envelope	Ugence Risk Authority	Case: authorization reference
Attempt	What command was attempted	Ugence Agent Runtime (Pattern B) / ServiceNow (Pattern A)	Case / flow record
Receipt	What actually executed	External system	Case: receipt reference
Effect verification	Observed effect vs authorization	Ugence RA-8	Case: effect result; IRM issue on mismatch

Table 8. Four distinct records, and where each lands in ServiceNow.

RA-7 and RA-8 emit neutral reassessment signals to RA-6, which may only restrict authority (revoke / epoch / expire); RA-8 never retroactively authorizes an action, and verification strength is honestly bounded by the effect source. Per the v2.0 brief, the RA-5 → RA-8 packages are IMPLEMENTED and CI-verified at the library level, while end-to-end operational enforcement is PARTIAL.

19. ServiceNow product-to-pipeline mapping

This table maps each pipeline stage to the ServiceNow product(s) and the Ugence module(s) involved. It is Deliverable A.

Pipeline stage	ServiceNow product(s)	Ugence module(s)	Status
Reference evidence (zero-copy where supported)	Workflow Data Fabric / Zero Copy Connectors	—	PROPOSED SERVICENOW INTEGRATION
Ingest events / orchestrate	IntegrationHub / Stream Connect / REST	—	PROPOSED SERVICENOW INTEGRATION
Create / update the case	PSDS case management / Investigative Case Management where licensed and available (on the CSM case foundation)	—	PROPOSED SERVICENOW INTEGRATION
Assemble context	PSDS; IRM / Policy & Compliance; AI Control Tower; CMDB (+ optional OT)	—	PROPOSED SERVICENOW INTEGRATION
Admit trusted evidence	—	RA-5 Trusted Evidence Admission	IMPLEMENTED + CI (lib)
Bind the decision	—	Decision Authority (DecisionCase + CER)	IMPLEMENTED + CI
Model eligibility	AI Control Tower (fact)	Model Authority	IMPLEMENTED
Mint the signed authority	IRM (policy refs)	Risk Authority	IMPLEMENTED + CI (issuance PARTIAL)
Authorize the exact action	—	ActionGate	IMPLEMENTED + CI
Live clearance	—	Action Clearance	IMPLEMENTED
Dispatch the authorized action	Flow Designer / AI Action Fabric / IntegrationHub	(Pattern A)	PROPOSED SERVICENOW INTEGRATION
Coordinate agentic steps	Agentic Playbooks / AI Action Fabric	Agent Runtime (Pattern B)	IMPLEMENTED + CI
Execute externally	(external system via ServiceNow)	—	—
Assure & reconcile	—	RA-7 / RA-8 / RA-6	IMPLEMENTED + CI (lib)
Write back & report	PSDS case; IRM issue; AI Control Tower audit; Platform Analytics	Governed Value (experimental)	PROPOSED SERVICENOW INTEGRATION

Table 9. Product-to-pipeline mapping.

20. Discovery questions to confirm with ServiceNow

These are the items that could not be page-verified from official documentation in this preparation environment, or that depend on the customer's release, instance and contract. Each should be confirmed with ServiceNow (for the partnership discussion, with Praneeth). This is Deliverable E.

#	Area	Question to confirm with ServiceNow
D-1	PSDS	Exact PSDS SKU / entitlement; which Store apps are in the base entitlement vs sold separately; does the government data model natively carry jurisdiction, approvals and external-reference fields, or are these configured?
D-2	Investigative Case Mgmt	Confirm the "Q1 2026, all PSDS customers" availability; exact entity/table names and the event-entity schema; native modelling of jurisdiction, approvals and external-agency reference IDs; whether ICM needs a SKU beyond base PSDS.
D-3	CSM foundation	Which CSM tier underpins PSDS/ICM, and whether CSM is bundled into PSDS entitlement or separate; base case table and fields PSDS/ICM extend.
D-4	Workflow Data Fabric	Does zero-copy leave data fully at rest for all connector types; exact "Data Fabric credits" / entitlement/tier model for projected query volume.
D-5	IntegrationHub	Which specific spokes the external-system integrations require (OOTB vs Store vs custom); edition/transaction entitlement for projected volume.
D-6	Workflow Studio / Flow Designer	For the target release, does Workflow Studio fully replace the standalone Flow Designer UI; any capabilities that remain one-or-the-other.
D-7	AI Action Fabric	Confirm the exact current product name and its spelling on docs.servicenow.com for the target release ("ServiceNow AI Action Fabric," sometimes shortened to "Action Fabric"); GA scope for the target release; whether AI Control Tower governance is mandatory/enforced for all externally-dispatched actions or configurable; whether AI Gateway is required vs recommended for sensitive-data MCP traffic.
D-8	AI Control Tower	Is "AI Use Case registration" a first-class documented object and its table/record name; ownership fields/roles; current licensing (bundled vs standalone) and GA status of expanded capabilities as of 2026-08-15.
D-9	IRM / Policy & Compliance	Does ServiceNow use the phrase "system of record" for IRM; precise current module and table names (authority document, citation, control objective, control, policy exception, issue); packaging/entitlement.
D-10	Agentic Playbooks	Exact activity name and whether they coordinate multiple agents or one embedded agent per activity; release and Now Assist / AI Agents entitlement.
D-11	CMDB	Baseline CMDB inclusion; which advanced features (Service Graph Connectors, CSDM) need additional entitlement.
D-12	OT Management	OOTB discovery / CI classes for cameras and traffic/rail signal controllers, or custom modelling; entitlement and dependency on Discovery / Vulnerability Response.
D-13	Analytics	Which tier (Performance Analytics Pro/Premium vs baseline; Platform Analytics baseline) is required for the intended KPI/ROI dashboards, and license-consuming roles.
D-14	FSM	Which FSM package/tier; is AI Schedule-and-Dispatch Optimization included or an add-on.
D-15		

#	Area	Question to confirm with ServiceNow
	SIR / Security Case Mgmt	Which SecOps SKU covers SIR; is “Security Case Management” a standalone product or the workspace/case framework; is “Physical Security Case Management” the relevant offering for camera/OT security; licensing.
D-16	Release pinning	Pin all cited docs URLs to the customer’s target release family (current: Zurich) and re-verify against the live pages before customer use.

Table 10. Discovery questions.

21. Source and citation register

Official ServiceNow sources for each capability, with complete URLs, in the documented priority order (product documentation → release notes → Newsroom → product pages). Access date: **15 August 2026**. Where a documentation URL is release-pinned, the release is named in parentheses; re-open each page and pin it to the customer’s target release (current family: Zurich) before customer use. Ugence architecture and maturity are cited from the vendor-neutral v2.0 brief and the Ugence repository. This is Deliverable F.

Ugence module behavior and maturity are cited from the vendor-neutral v2.0 brief and the Ugence repository default branch. Any capability, SKU, table, API, licensing or availability specific that is release-, instance- or contract-dependent is treated as a discovery question (Section 20), to be confirmed against the live page for the customer’s release before customer use.

22. Phased pilot

Autonomy is earned step by step; live controlled dispatch is not enabled until dry-run, exception-path and receipt checks pass. Every integration remains PROPOSED until built and confirmed with ServiceNow.

Figure 10. A phased adoption roadmap from discovery to assurance-and-value, integrated with ServiceNow.

Phase	Exit criterion
0 · Discovery	Discovery questions (Section 20) resolved with ServiceNow; products, editions, data model and licensing confirmed; action inventory approved.
1 · Shadow governance	Disposition quality validated against historical / live review, with no blocking.
2 · Low-risk runtime gates	Selected searches / registry calls / disclosures gated before dispatch; no bypass paths; latency and fail behavior accepted.
3 · Enforcement gate	ActionGate + Action Clearance before citation dispatch; end-to-end evidence / authority / action tests pass.
4 · Agentic governance	Agentic Playbook / AI Action Fabric and Agent Runtime routes governed; scope-expansion and escalation adversarial tests pass.
5 · Assurance & value	RA-8 write-back to PSDS / IRM; AI Control Tower audit; Platform Analytics KPIs; production assurance SLOs and audit KPIs sustained.

Table 12. Phase exit criteria.

23. Appendix — Ugence module reference and glossary

The Ugence modules referenced above are unchanged from the vendor-neutral v2.0 brief. Maturity is repository-backed (default branch).

Module (repository name)	Role	Maturity
RA-5 — risk-authority-evidence-runtime	Trusted evidence admission + control assurance	IMPLEMENTED + CI (lib); integration PARTIAL
TAP — ugence-tap-provider	Assertion / control-support evaluator RA-5 wraps	IMPLEMENTED + CI
Decision Authority — ugence-decision-authority	DecisionCase (immutable/versioned) + CER; binding decision	IMPLEMENTED + CI
Model Authority — ugence-model-selection	Per-action model-authorization decision	IMPLEMENTED (no dedicated CI)
Risk Authority — ugence-risk-authority	Signed Ed25519 authorization envelope (sole machine authority)	IMPLEMENTED + CI; production issuance PARTIAL
ActionGate — ugence-actiongate-provider	Exact-action authorization (AUTHORIZED / DENIED / INDETERMINATE / EXPIRED)	IMPLEMENTED + CI
Action Clearance — ugence-action-clearance	Live-safety clearance (CLEAR / HOLD / BLOCK / ESCALATE)	IMPLEMENTED (no dedicated CI)
Agent Runtime — ugence-agent-runtime	Governed execution coordination (fails closed)	IMPLEMENTED + CI
RA-7 / RA-8 / RA-6	In-flight assurance / effect reconciliation / authority lifecycle	IMPLEMENTED + CI (lib); end-to-end PARTIAL
Policy Workflow Compiler — ugence-policy-workflow-compiler	Compiles an approved policy pack into runtime constraints (tooling, not authority)	IMPLEMENTED + CI (offline)
Governed Value — ugence-governed-value	Reported net governed value / ROI (experimental)	IMPLEMENTED (experimental; reported-only)

Table 13. Ugence module reference (maturity from v2.0).

23.1 Glossary

Term	Definition
PSDS	Public Sector Digital Services — ServiceNow's digital-government platform (case foundation from CSM).
ICM	Investigative Case Management — AI-native government investigation case capability within PSDS.
IRM	Integrated Risk Management — ServiceNow's GRC suite; system of record for policy/controls.
AI Control Tower	ServiceNow's command center to discover/observe/govern/secure/measure enterprise AI.
ServiceNow AI Action Fabric	ServiceNow's system of action exposed to AI agents via the MCP Server, governed by AI Control Tower. Some official materials shorten it to "Action Fabric".
IntegrationHub	

Term	Definition
	ServiceNow integration framework; spokes (grouped actions/subflows) to external systems.
Workflow Data Fabric	ServiceNow unified data foundation; Zero Copy Connectors reference external data without moving it.
CER	Context Envelope Record — the Ugence governance context record owned by Decision Authority.
DecisionCase	The Ugence governed decision & authority container (not the ServiceNow case of record).
Pattern A / B	ServiceNow-led dispatch / Ugence Agent Runtime coordination — never simultaneous owners of execution.
PROPOSED SERVICENOW INTEGRATION	No Ugence ServiceNow connector ships; the integration is illustrative and subject to discovery.

Table 14. Glossary.

End of document. This is a conceptual, PROPOSED integration architecture and illustrative case study, grounded in the current Ugence repository and official ServiceNow sources identified on 2026-08-15 (page-verify before customer use). It is not legal advice, not a claimed deployment, and not ServiceNow-endorsed.
